CLEMATIS PRUNING GROUPS and GUIDELINES

Pruning a Clematis is usually not necessary, but at times is beneficial for shaping and better flowering. Follow the corresponding number for each variety. These are guidelines only, call/email us with any additional questions.

Group 1 : Early Flowering (blooms mostly in spring on previous season's growth, usually no pruning necessary but may prune back soon after flowering)

generally do not need pruning but can be kept in check if needed; prune within one month after blooming, prune back 1-2' for overall appearance

Group 2 : Mid-Season Flowering (blooms mostly in early summer on previous season's growth, repeats bloom in summer on current season's growth, prune in late winter or early spring back to previous year's wood/growth)

prune in late winter or early spring; remove dead or weak shoots and prune remaining shoots back about 1-2' for overall appearance

Group 3 : Late-Season Flowering (blooms mostly in mid-late summer on current season's growth, repeats bloom in fall, prune 1/3 of the stems each year back to previous year's wood/growth)

prune in late winter or early spring; prune about 1/3 of shoots back about 1-2' each season for overall appearance

Group 4 : Small-Flowering (varieties that produce small flowers, usually no pruning necessary but may prune to shape at any time of year)

generally do not need pruning; can be pruned back after blooming if overgrown for the area in which they are located

CONVALLARIA (Lily of the Valley)

Often goes dormant after flowering. Sometimes orange-red berries will be produced in the fall which can be removed due to their toxicity.
